ABI4 is involved in regulating seed development, production of seed nutrient reserves and desiccation protectatis. The nucleic acid can be used to create transgenic plants with modified regulation of seed viability, production of nutrient reserves and desiccation protectants in seeds and vegetative stress tolerance, e.g. to drought or salinity, and
                                                                                                                                                                                                                                                        ö
Arabidopsis thallana homozygous for the abi4-2 (san5) allele are tolerant of high concentrations of sodium chloride (150 mM), mannitol (400 mM), potassium chloride (150 mM) and sodium sulphate (75 mM). The abi4-2 (san5) allele is used to produce Arabidopsis plants that are able to germinate and grow in highly saline soils in which wild-type plants connot survive. Orthologous alleles from other crop plants can be used to impart similar properties. The present sequence represents the abi4 protein encoded by the mutant allele abi4. This protein contains the APETALA2 domain, but is C-terminally truncated with respect to the wild-type ABI4 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Abi4 gene; seed development regulation; seed nutrient reserve production; desiccation protectant; vegetative stress tolerance.
                                                                                                                                                                                                                                                            Gaps

The invention relates to a null, or extremely hypomorphic, allele of the invention relates to anull, or extremely hypomorphic, allele of the ABI4 gene of Arabidopsis thaliana that confers insensitivity to the ABI4 germination. The allele, designated sans or abit 4.2, has a deletion of one of the three adenines at cesignated sans or abit 4.2, has a deletion of one of the three adenines at positions 277-279 relative to the wild-type allele (designated ABB4), consisting from amino cid residue 44 onwards. The abit 4-2 protein contain the APETALA2 (AP2) domain located between containing from amino acid residue 44 onwards. The abit 4-2 protein containing from amino acid residue ABB4 protein (AABB9925) which mediates residues 55-110 in the wild-type ABB4 protein (AABB9923) which mediates contained and activity at C-repeat/DRE regulatory elements. Seeds of transactivational activity at C-repeat/DRE regulatory elements. Seeds of this concentrations of sodium chloride (150 mM), mannitol (400 mM), containing the concentrations of sodium sulphate (75 mM). The abit 4.2 potassium chloride (150 mM) and sodium sulphate (75 mM). The abit 4.2 germinate and grow in highly saline soils in which wild-type plants cannot survive. Orthologous alleles from other crop plants can be used to impart similar properties. The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New null allele of the Arabidopsis thaliana ABI4 gene, useful for imparting insensitivity to abscisic acid and ability to germinate and grow on saline soils
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for modulating a response in a target plant to abscist acid (ABA) by introducing a DNA construct comprising an ABA-associated sequence operably linked to an early kernel/embryo promoter into the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly cereal plants such as maize, which have a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/detrimental caffects of stress and adverse environmental conditions. The ABA function is disrupted in a tissue and developmental preferred manner so that female reproductive tissue is insulated from the stress or adverse environmental conditions. Other plants which can be transformed include rice, cotton, citrus trees, tomatces, pines, soybean, peanut and olive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA constructs containing an abscisic acid-associated sequence are used to modulate a response in a plant to abscisic acid so that the plants are protected against any harmful or detrimental effects of stress and environmental conditions -

The sequence represents a human secreted protein encoded by a nucleic acid of the invention. Secreted proteins and their related nucleic acids can be used in the diagnosis of or susceptibility to a pathological condition by determining the presence or absence of a mutation in a nucleic acid or the presence or amount of expression of a secreted condition by determining the presence or amount of expression of a secreted condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The antibodies to the polypeptides can also be used in alleviating symptoms associated with disorders and in diagnostic alleviating symptoms associated with disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linkedoc immunosorbent carbuits, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. neoplasms of the breast or disorders e.g. cerebral ischaemia, angiogenesis, nervex, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac aurest, cerebrovascular disorders e.g. corneal infection. The peptides can also be used to aid wound healing and epithelial cell proliferation, to help prevent skin ageing due to sumburn, to maintain organs before transplantation, to regenerate tissues, in chemotaxis and as a food cransplantation, to regenerate tissues, in chemotaxis and as a food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

New maize replication protein A useful for genetic transformation, gene targeting in plants and modulating DNA metabolism -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Maize: Replication protein A: RAA: middle subunit; ZmRPAMSH: virucide; fungicide: insecticide; chromosome 5; DNA-binding protein; DNA repair; DNA metabolism: DNA replication; cell cycle; homologous recombination; pathogen resistance; fungi; virus; nematode; insect; gene therapy; genetic manipulation.
                                                                                                                                                                                                                                                                  The present sequence is the maize replication protein A (RPA) middle subunit homologue-1 (ZmRPAMSH1). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the zmRPAMS homologue is mapped to chromosome 5. This sequence has fungicale, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therappy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
The present sequence is the maize replication protein A middle subunit homologue-2 and 3 (ZmRPAMSH2 and ZmRPAMSH3). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the ZmRPAMS homologue is mapped to chromosome 5. This sequence has fungicide, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therapy.

            The present sequence is the maize replication protein A (RPA) middle subunit homologue-4 (ZmRPAMSH4). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the ZmRPAMS homologue is mapped to chromosome 5. This sequence has fungicide, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Nucleotide sequence of a cDNA coding for the NADPH-
protochlorophyllide oxidoreductase (PCR) of barley (Hordeum vulgare
protochlorophyllide oxidoreductase (PCR) of barley (Hordeum vulgare
L) and its expression in Escherichia coll.";
Mol. Gen. Genet. 217:355-361(1989).
-1- FUNCTION: PHOTOTRANSFORMATION OF PROTOCHLOROPHYLLIDE (PCHLIDE) TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CHLOROPHYLLIDE (CHLIDE).
CATALUTIC ACTIVITY: CHLOROPHYLLIDE A + NADP(+) =
PROTOCHLOROPHYLLIDE + NADPHYLLIDE + NADPHYLLIDE + NADPHYLLIDE
PATHWAY: CHLOROPHYLL BIOSYWHESIS.
SUBCELLUIAR LOCATION: CHLOROPLAST.
BUYELDEMBRYATA, STAGE: ACTIVE ONLY TRANSIENTLY IN ETIOLATED
SEEDLINGS AT THE BECINNING OF ILLUMINATION.
SIMILARITY: BELONGS TO THE SHORT-CHAIN DEHYDROGENASES/REDUCTASES
                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hordeum vulgare (Barley).

"Characterization of an AP-1-like transcription factor that mediates an oxidative stress response in Kluyveromyces lactis.";

MOI, Gen. Genet. 257:62-70(1997).

-1- FUNCTION: MEDIATES OXIDATIVE STRESS RESPONSE. INVOLVED IN BOTH THE OXIDATIVE ND CADMIUM RESPONSE PATHWAYS.

-1- SUBJECTULIAR LOCATION: NUCLEAR.

-1- SIMILARITY: TO OTHER BZIP PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

-!- FUNCTION: THIS IS A RECEPTOR FOR RETINDIC ACID. THIS METABOLITE
HAS PROFOUND EFFECTS ON VERTEBRATE DEVELOPMENT. RETINDIC ACID IS
A MORPHOGEN AND IS A POWERFUL TERATOGEN. THIS RECEPTOR CONTROLS
CELLS FUNCTIONS BY DIRECTLY RECULATING GENE EXPRESSION.
-!- SUBCELLULAR LOCATION: NUCLEAR.
-!- DEVELOPMENTAL STAGE: IT IS SYNTHESIZED DURING OOGENESIS AND
PERSISSI IN THE CLEAVING EMBRYO AT APPROXIMATELY CONSTANT LEVELS
UNTIL IT IS DEGRADED JUST BEFORE GASTRUATION.
-!- DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN.
-!- SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.
-!- SIMILARITY: PRECNICS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.
NR1 SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE FROM N.A.

The present sequence is the antigenic epitope P605, derived from the present sequence is the antigenic epitope P605, derived from the rhopery associated protein-1 (RAP-1) of the asexual blood stage of the separation of recombinant protein CpC/NIIMALVAC-1, which is a multivalent, multistage malarial protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial conformer. The recombinant protein comprises, melittin signal peptide, vaccine. The recombinant protein (CSP), sporozoite surface protein-2 from circumsporozoite protein (CSP), sporozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (ASP-1), malarial in an gamete antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant of protein comprises, melitin signal peptide, (His)6 tag, T-cell epitope protein comprises, melitin signal peptide, (His)6 tag, T-cell epitope content tetanus toxoid and 21 antigenic epitopes from circumsporzolte from tetanus toxoid and 21 antigenic epitopes from circumsporzolte content of protein (GSP), sporzolte surface protein (GSP-2), liver stage antigen-1 (LSA-1), merocolte surface protein 1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen Pfg27.

These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting the content of the life cycle of protein in biological samples.

ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the oplypeptides. The polypeptides (II) fand/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their creatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 to the avamalification of the present invention.
                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification,
                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

    S. epidermidis open reading frame protein sequence SEQ ID NO:2230.

                                                                                                                                                                                                                                                       ö
                                                                                     expression system using plasmid pMC9, and may then be used for immunisation against malaria. The product may also be used diagnostically to detect Abs directed against the parasite.
                                                                      Gene product may be isolated from a transformed E.coli (Y1088)

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (II) given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) wat the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent percent come the present invention. AAH55091 to AAH5509 represent oligonaciocide sequences and primers which are used
                                                                                                                                                                               ö
however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472,
                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S. epidermidis open reading frame protein sequence SEQ ID NO:2906.

The polynucleotide sequences given in AAC79799 to AAC79848 encode the human secreted proteins given in AAB44762 to AAB44811. AAB44812 to human secreted proteins sequences and proteins.

AAB44829 represent human secreted polypeptide sequences and proteins. CC homologous to them, which are used in the exemplification of the present invention. Human secreted proteins have activities based on the tissues invention. Human secreted proteins have activities are: consumptionally an ariarthritic; antirhematic; antirpoliferative; cytostatic; cardiant; vasortopic; antirhematic; antirpoliferative; cytostatic; cardiant; varioride; fungicide; and neuroprotective; antibaterial; virucide; fungicide; and cophthalmological. The polynucleotides and polypeptides can be used to ophthalmological. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, combits, notes, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a companied condition. Disorders which are diagnosed or treated include disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by bacteria, viruses and fungi and ocular condition caused by bacteria, viruses and fungi and companied and ocular condition or supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The

The polynucleotide sequences given in AAC79799 to AAC79848 encode the human secreted proteins given in AAB44762 to AAB44811. AAB44812 to AAB44829 represent human secreted polypeptide sequences and proteins concluded to the proteins are used in the exemplification of the present human secreted proteins have activities based on the tissues invention. Human secreted proteins have activities are:

and cells the genes are expressed in Examples of activities are:

inmunosuppressive; antiarthritic; antirhumatic; antiproliferative;

cytostatic; cardiant; vasotropic; cerebroprotective; nootropic;

cytostatic; cardiant; vasotropic; cerebroprotective; and polypeptides can be used to ophthalmological. The polynucleotides and polypeptides can be used to ophthalmological. The polynucleotides and polypeptides can be used to rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition are diagnosed or treated include pathological condition are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular
                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; secreted protein; diagnosis; immunosuppressive; antiarthritic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; antibacterial; virucide; fungicide; ophthalmological; gene therapy; autoimmune disease; infection; hyperproliferative disorder; cardiovascular disorder; angiogenesis; cerebrovascular disorder; nervous system disorder; ocular disorder; wound healing; skin aging; food additive; preservative.
polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC79790 to AAC79798 and AAB44761 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding human secreted proteins, used to treat, prevent,

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat
                   disorders, infections caused by bacteria, viruses and fungi and occular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC79790 to AAC79799 and AAB44761 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of
disorders, cerebrovascular disorders, angiogenesis, nervous system

FOR CONFERRING HERBICIDE TOLERANCE AND AN ALTERATION IN
OIL CONTENT OF PLANTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APPLICANT:
TITLE OF INVENTION: METHODS AND AN ACETYL CON CONTROL OF TITLE OF INVENTION: FOR CONFERRING HERBICIDE TOLERANCE AND ITTLE OF INVENTION: OIL CONTENT OF PLANTS
NUMBER OF SEQUENCES: 11
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30 (EPO)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/417,089
INFORMATION FOR SED ID NO: 6:
SEQUENCE CHARACTERISTICS:
LENGTH: 2325 amino acids
TYPE: amino acids
TYPE: amino acids
TYPE: anino acids
TYPE: Amino acids
TYPE: AMINEDNESS: Single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 41; DB 3; Length 2325;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 6, Apsence 6, Agequence 15, Asequence 16, Asequence 5, Asequence 5, Asequence 5, Asequence 2, Aseque
